# **WEATHER SYNOPSIS BY REGION**

## **NORTHERN CALIFORNIA**

Wet unsettled weather will prevail across the region through early today. Snow levels are 6000 ft in the north and 7000 ft in the south, but they will drop to 5000-6000 ft early today as colder air moves in, but the rain will diminish down to mountain showers tonight as well. Dry and mild weather can be expected from midday today through tomorrow evening.

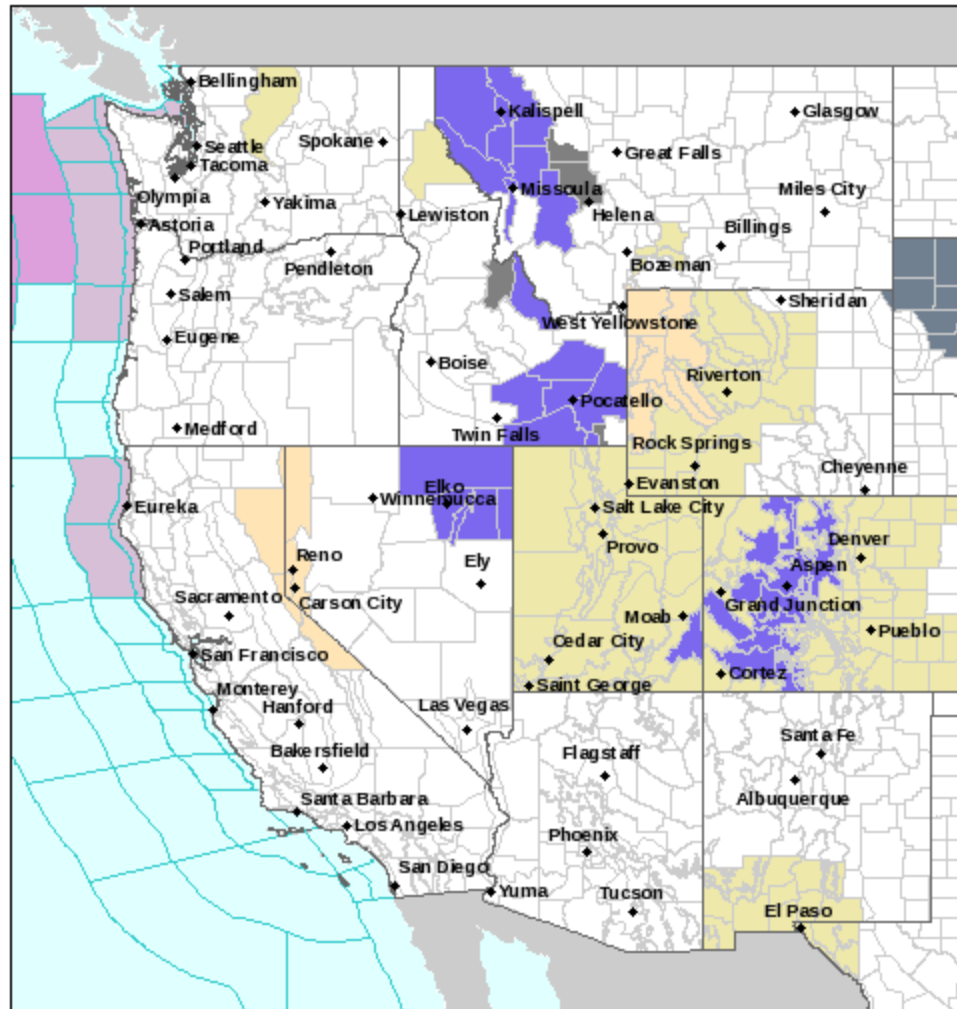

Another stretch of wet unsettled weather can be expected Monday through Wednesday, with relatively high snow levels. Dry and mild weather will follow late next week. Overall, mountain areas can expect 5 or more inches of liquid equivalent precipitation in the next week, and interior valleys will see 0.50-1.50 inches.

## **SOUTHERN CALIFORNIA**

A few light showers will continue through today across the central coast and Sierra Foothills. Additional rainfall will be under a quarter of an inch. Otherwise, look for partly to mostly sunny skies today with highs remaining 5-10 degrees above normal. Highs will range from the 50s in the mountains to the mid 70s across the valleys and low desert of the region. West winds will increase to 20-30 mph today along the Sierras, Kern County Mountains, Antelope Valley and the higher elevations of the Inyo National Forest. These winds should decrease tonight. Monday and Tuesday, the first storm system of the season to bring widespread, meaningful precipitation to the area will finally arrive. Bands of rain will reach the central coast as soon as the pre-dawn hours Monday morning with rain becoming likely over the Sierras by Monday afternoon. Gusty south winds of 20-30 mph will be possible, especially across the desert, Owens Valley and the transverse ranges of the region. The rain will spread southward to include the region Monday night into Tuesday. Rainfall rates exceeding a half inch per hour will be possible for a 3-6 hour period during the passage of the storm with the heaviest rain likely focused on the south aspects. The snow level will be high during this storm with accumulations limited to elevations above 6,000 feet during the heaviest period of precipitation. But snow levels may briefly fall to 4,500 feet by Tuesday night. In all, 2-3" of precipitation will be possible along the central coast, the Sierras from Fresno County northward and the south aspects of the Los Padres, Angeles and San Bernardino National Forest. The valleys and coastal plains of the region will likely see 1-2." The Kern County Mountains and most of the desert may receive around a half inch of precipitation. Some of the most intense precipitation during this storm may occur across the western half of the Thomas Fire which may result in mud and debris flows. After the storm passes, expect strong north winds through the I-5 corridor and other wind-prone areas Tuesday night into Wednesday. Temperatures will be cool during the first half of the week, but warmer weather may return by the weekend of the 13th.
